Integrated security control within reach

One graphical user interface

Easy to use

Tablet integration

Full AXIS  
product range integration

Sky-Walker3  
STRATO

# Sky-Walker3 Strato

The management of security in small to medium sized buildings inevitably falls to available staff such as receptionists and caretakers. Managing security compromises their primary role and requires them to be mobile. Dealing effectively and swiftly with important security issues, whilst still performing their main role, is not always an easy task. Sky-Walker3 Strato allows them to maximise their effectiveness and to **stay in control of all the important security tasks**. For example: Remotely opening main entrance doors, using your video surveillance, arming and disarming intrusion blocks or addressing intercom calls all from a single workstation.

Sky-Walker3 Strato is a **fully integrated mobile security solution** especially intended for small and medium businesses, providing the same features as large scale integration platforms. The comprehensive and intuitive graphical user interface eliminates the need for multiple control panels required to operate the many security systems protecting a building. A tablet interface is also available with the same functionality as the main workstation allowing **complete mobility without compromising on security management**.

## Complete security control

The user interface of Sky-Walker3 Strato provides full control, monitoring and administration of all security systems from a centralized high definition display. The graphical and intuitive setup makes the system easy to operate for receptionists or security guards without the need for having any technical skills or extensive training.

All these control functions are combined in one interface. Just one screen (tablet, smartphone or workstation) provides operational control of all relevant security functions.

## Easy to use

Simplicity of usage was an important development objective for Sky-Walker3 Strato. Therefore the system uses geographical map views to show the operator the exact location of all security objects, such as cameras or doors. Control of these objects is managed directly by selecting them in the map views.

## Efficient overviews

The Sky-Walker3 Strato software contains an alarm monitoring buffer **displaying all incoming alarms and messages from the connected security systems at a glance**. These alarms and messages can automatically interact with live camera views.

For example: if a forced door alarm is accepted by the operator, automatic live views of the nearest cameras are switched on. Or, if an intercom call is accepted the live camera view of the visitor is automatically shown.

## Reports

In addition to managing your security processes, you are also able to **create reports** concerning all security matters at facility level. Measurement of effectiveness

and efficiency is **key to your cost savings**. Would you like a detailed overview on the occupancy of your building environment? Or an analysis of false alarms generated in the past? With Sky-Walker3 Strato they are only a few clicks away.

## Remote monitoring & control

Security management is available on mobile devices such as tablets. If an operator has to leave their desk temporarily, supervision of security events is still possible.

No manned system over the weekend? Sky-Walker3 Strato still monitors your security alarms, system messages and technical failures. Critical alarms can be forwarded to preconfigured e-mail addresses to assure fast response and follow-up.

# Security integrations

## So how does the platform work exactly?

By bringing your technologies under the Entelec umbrella and by providing a central monitoring location for all of these systems through Sky-Walker3 Strato, you benefit from a set of capabilities which guarantee top-level intelligence at all times for:

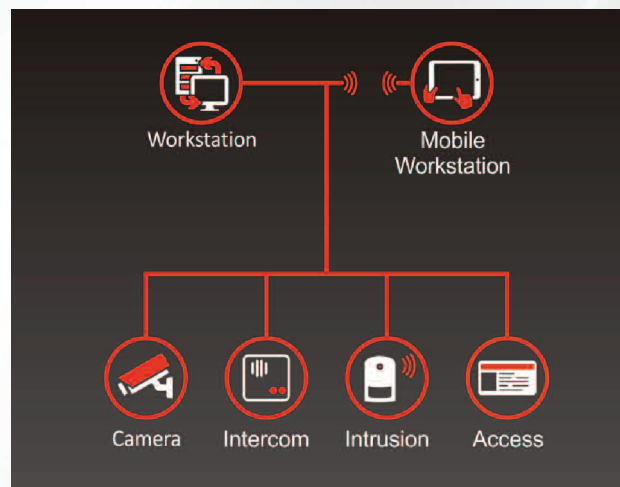

- **Access control**
- **Camera observation**
- **Intrusion detection & prevention**
- **Intercom**

### Access control

The daily **management of your access control systems just got a lot easier!** Open doors and gates remotely, manage users, activate new badges, appoint user rights and much more in no time. Sky-Walker3 Strato also monitors possible security issues such as 'forced door' and 'door open' alarms. The Sky-Walker3 plugin for access control was developed in close co-operation with AXIS Communications, one of the world leaders in IP Camera systems and IP controllers.

With the integration of the recently introduced **AXIS door controller**, Sky-Walker3 Strato is able to manage access doors including the necessary card readers. The door controller supports multiple access card technologies and is fully equipped to control a wide variety of electromechanical locks & crossing gates.

### Camera observation

Traditionally, Entelec has always supported the integration of all AXIS camera products such as IP fixed and dome cameras, encoders and decoders.

### Intrusion & intercom

For intrusion and IP intercom system integration, Sky-Walker3 Strato acts as an open platform and software interface for any A-brand system and is available to complete a fully integrated security solution.

Entelec Control Systems, founded in 1992, is a software company specialized in the development and implementation of system integration solutions for the efficient management of all the technical, safety and security systems within buildings. We use our experience to assess & prioritise customer's requirements and identify their problems and shortcomings to build them a solution that meets their needs and wants perfectly.

With offices in Belgium (HQ), The Netherlands, France and United Kingdom, we are strategically positioned to provide our customers and partners with efficient service and support.
